Cosmic Strings

T. Kibble, J. Phys. A **9**, 1387 (1976); Y. B. Zeldovich, Mon. Not. Roy. Astron. Soc. **192**, 663 (1980); A. Vilenkin, Phys. Rev. Lett. **46**, 1169 (1981).

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- **Cosmic string = linear topological defect** in a quantum field theory.
- 1st analog: line defect in a crystal.
- 2nd analog: vortex line in superfluid or superconductor.
- **Cosmic string = line of trapped energy density** in a quantum field theory.
- Trapped energy density \rightarrow gravitational effects on space-time \rightarrow important in cosmology.

Relevance to Particle Physics I

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- Cosmic string solutions **exist** in many particle physics models **beyond the “Standard Model”**.
- Cosmic strings are **predicted** to form at the end of inflation in many **inflationary models**.
- Cosmic strings **may survive** as cosmic superstrings in alternatives to inflation such as **string gas cosmology**.
- In models which admit cosmic strings, cosmic strings **inevitably form** in the early universe and **persist to the present time**.
- Seeing a cosmic string in the sky would provide a guide to particle physics beyond the Standard Model!

Relevance to Particle Physics II

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- Cosmic strings are characterized by their **tension** μ which is associated with the energy scale η at which the strings form ($\mu \sim \eta^2$).
- Searching for the signatures of cosmic strings is a **tool to probe physics beyond the Standard Model** at energy ranges complementary to those probed by the LHC.
- Cosmic strings are constrained from cosmology: $G\mu \leq 1.3 \times 10^{-7}$ otherwise a conflict with the observed acoustic oscillations in the CMB angular power spectrum (Dvorkin, Hu and Wyman, 2011).
- Existing **upper bound** on the string tension rules out large classes of “Grand Unified” models.

Lowering the upper bound on the string tension by two orders of magnitude would rule out **all** grand unified models yielding cosmic string solutions.

Relevance to Cosmology

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

Strings can produce many **good things** for cosmology:

- String-induced mechanism of baryogenesis (R.B., A-C. Davis and M. Hindmarsh, 1991).
- Explanation for the origin of primordial magnetic fields which are coherent on galactic scales (X.Zhang and R.B. (1999)).
- Origin of high redshift supermassive black holes (S. Bramberger, R.B., P. Jreidini and J. Quintin, 2015).
- Origin of globular clusters (A. Barton, R.B. and L. Lin, 2015; R.B., L. Lin and S. Yamanouchi, 2015).
- Origin of fast radio bursts (R.B., B. Cyr and A. Iyer, 2017).

It is interesting to **find evidence** for the possible existence of cosmic strings.

Key Points

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- Cosmic strings → **nonlinearities** already at arbitrarily **high redshifts**.
- Signatures of cosmic strings **more pronounced** at **high redshifts**.
- Cosmic string **wakes** lead to perturbations which are **non-Gaussian**.
- Cosmic string **wakes** predict specific geometrical patterns in **position space**.
- **21 cm surveys** provide an ideal arena to look for cosmic strings (R.B., R. Danos, O. Hernandez and G. Holder, 2010).

Cosmic String Review

A. Vilenkin and E. Shellard, *Cosmic Strings and other Topological Defects* (Cambridge Univ. Press, Cambridge, 1994).

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- Strings form after symmetry breaking phase transitions.
- Prototypical example: Complex scalar field ϕ with "Mexican hat" potential:

$$V(\phi) = \frac{\lambda}{4} (|\phi|^2 - \eta^2)^2$$

- **Vacuum manifold** \mathcal{M} : set up field values which minimize V .
- At high temperature: $\phi = 0$.
- At low temperature: $|\phi| = \eta$ - but **phase uncorrelated on super-Hubble scales**.
- \rightarrow **defect lines with $\phi = 0$ left behind**.
- Trapped energy along the defect lines.
- Existence of cosmic strings requires: $\Pi_1(\mathcal{M}) \neq 1$.

Formation of Strings

T. Kibble, Phys. Rept. **67**, 183 (1980).

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- By **causality**, the values of ϕ in \mathcal{M} cannot be correlated on scales larger than t .
- Hence, there is a probability $\mathcal{O}(1)$ that there is a string passing through a surface of side length t .
- **Causality** \rightarrow network of cosmic strings persists at all times.

Sketch of the Scaling Solution

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

Figure 39. Sketch of the scaling solution for the cosmic string network. The box corresponds to one Hubble volume at arbitrary time t .

Network of strings consists of

- “Long” strings.
- String loops.

Plan

Cosmic
Strings

Signatures in
21cm

Conclusions

- 1 Motivation
- 2 **Kaiser-Stebbins Effect and Cosmic String Wakes**
- 3 Signatures of Cosmic String Wakes in 21cm Maps
- 4 Conclusions

Kaiser-Stebbins Effect

N. Kaiser and A. Stebbins, Nature **310**, 391 (1984).

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- Space away from the string is **locally flat** (cosmic string exerts no gravitational pull).
- Space perpendicular to a string is **conical** with **deficit angle** $\alpha = 8\pi G\mu$
- Photons passing by the string undergo a **relative Doppler shift**

$$\frac{\delta T}{T} = 8\pi\gamma(v)vG\mu,$$

- \rightarrow network of **line discontinuities** in CMB anisotropy maps.
- *N.B. characteristic scale: comoving Hubble radius at the time of recombination \rightarrow need **good angular resolution** to detect these edges.*

Cosmic String Wake

J. Silk and A. Vilenkin, Phys. Rev. Lett. **53**, 1700 (1984).

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

Consider a cosmic string moving through the primordial gas:

Wedge-shaped region of overdensity 2 builds up behind the moving string: **wake**.

Closer look at the wedge

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- Consider a string at time t_i [$t_{rec} < t_i < t_0$]
- moving with velocity v_s
- with typical curvature radius $c_1 t_i$

Gravitational accretion onto a wake

L. Perivolaropoulos, R.B. and A. Stebbins, Phys. Rev. D **41**, 1764 (1990).

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- Initial overdensity → **gravitational accretion** onto the wake.
- Accretion computed using the Zeldovich approximation.
- **Result:** comoving thickness $q_{nl}(t) \sim a(t)$.

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- 21 cm surveys: **new window** to map the high redshift universe, in particular the “**dark ages**”.
- Cosmic strings produce **nonlinear structures** at high redshifts.
- These nonlinear structures will leave **imprints in 21 cm maps**. (Khatri & Wandelt, arXiv:0801.4406, A. Berndsen, L. Pogosian & M. Wyman, arXiv:1003.2214)
- 21 cm surveys provide 3-d maps → potentially more data than the CMB.
- → 21 cm surveys is a promising window to search for cosmic strings.

The Effect

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- $10^3 > z > z_H$: baryonic matter dominated by neutral H.
- Neutral H has hydrogen hyperfine absorption/emission line.
- CMB radiation passing through a cold gas cloud will be partially absorbed by exciting a 21cm transition. A hot gas cloud will produce 21cm radiation by a de-excitation transition.
- 21cm redshift surveys map the density distribution of neutral H.
- **21cm surveys: method to probe baryonic matter distribution before the epoch of star formation (i.e. in the "dark ages").**

The Effect (II)

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- **String wake** is a **nonlinear overdensity** in the baryon distribution with **special geometry** which emits/absorbs 21cm radiation.
- Low string tensions: signal is **absorption**.
- At high redshifts ($z > z_H$) the strings dominate the nonlinear structure and hence will dominate the 21cm redshift maps.

Conclusions

Brightness temperature

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

Brightness temperature:

$$T_b(\nu) = T_S(1 - e^{-\tau_\nu}) + T_\gamma(\nu)e^{-\tau_\nu},$$

Spin temperature:

$$T_S = \frac{1 + x_c}{1 + x_c T_\gamma / T_K} T_\gamma.$$

T_K : gas temperature in the wake, x_c collision coefficient

Relative brightness temperature:

$$\delta T_b(\nu) = \frac{T_b(\nu) - T_\gamma(\nu)}{1 + z}$$

Application to Cosmic String Wakes

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

Thickness in redshift space:

$$\begin{aligned}\frac{\delta\nu}{\nu} &= \frac{24\pi}{15} G\mu v_s \gamma_s (z_i + 1)^{1/2} (z(t) + 1)^{-1/2} \\ &\simeq 3 \times 10^{-5} (G\mu)_6 (v_s \gamma_s),\end{aligned}$$

using $z_i + 1 = 10^3$ and $z + 1 = 30$ in the second line.

Relative brightness temperature:

$$\begin{aligned}\delta T_b(\nu) &= [0.07 \text{ K}] \frac{x_c}{1 + x_c} \left(1 - \frac{T_\gamma}{T_K}\right) (1 + z)^{1/2} \\ &\sim 200 \text{ mK} \quad \text{for } z + 1 = 30.\end{aligned}$$

Signal is emission if $T_K > T_\gamma$ and absorption otherwise.

Comments

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

Cosmic string signal persists at lower redshifts.

But it is harder to calculate.

- Reionization.
- Nonlinearities.
- Disruption of string wakes (D. Cunha, O. Hernandez, R.B., arXiv:1508.02317)
- Numerical simulations in progress (D. Cunha et al, in preparation).

- 4 Conclusions

Conclusions I

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- Searching for cosmic strings in the sky is a way to **probe particle physics beyond the Standard Model from top down.**
- Current bounds on the cosmic string tension already rule out a large class of GUT models.
- Improving the bounds will allow us to better constrain particle physics beyond the Standard Model.

Conclusions II

Cosmic
Strings

R. Branden-
berger

Motivation

KS Effect and
Wakes

Signatures in
21cm

Conclusions

- Cosmic strings → **nonlinearities** already at **high redshifts**.
- Signatures of cosmic strings **more pronounced** at **high redshifts**.
- Cosmic string **wakes** lead to perturbations which are **non-Gaussian**.
- Cosmic string **wakes** predict specific geometrical patterns in **position space**.
- Cosmic string **wakes** produce distinct wedges in redshift space with enhanced 21cm absorption.
